in
Mathematical Institute of Serbian Academy of Sciences and Arts ,
Belgrade, Serbia, December 7, 2016

PROGRAM

Mini-symposium
“Biomechanics and Modelling of Biological Systems”

Минисимпозијум
„Биомеханика и моделовање биолошких система“

Organizer: dr Andjelka Hedrih
Department of Mechanics,
Mathematical Institute of Serbian Academy of Sciences and Arts,
Belgrade, Serbia

Acknowledgment: The International Mini-symposium "Biomechanics and Modelling of Biological Systems" has been organized by Project ON 174001 in the scope of the 70th anniversary of the Mathematical Institute of the Serbian Academy of Science and Arts. The Mini-Symposium was organized thanks to the financial support from the Serbian Ministry of Education, Science and Technological Development under the project:

ON 174001 "Dynamics of hybrid systems with complex structures. Mechanics of Materials", coordinated through Mathematical Institute of Serbian Academy of Sciences and Arts with Project Leader **prof.dr Katica (Stevanović) HEDRIH**.

PREFACE

Study of living systems and their substructures is the work of scientists from various scientific areas – biologists, medical doctors, molecular biologists, biochemists, physical chemists, technologists, physical scientists, mechanical engineers, electronics engineers, mathematicians, economist... Each studies a biological system or its part, organization, functioning under physiological and pathological conditions thus obtaining valuable knowledge. Diversity of analytical approaches to studying living systems is necessary in order to understand the complexity of structure and functions of biological systems, but it is also necessary to take one more step and that step is the synthesis of all these pieces of knowledge obtained by experts in various fields of science. For this, it is important that experts who study living systems exchange their knowledge and the main precondition for this is openness to experience and to a way of thinking that falls out of the cliché, and for them to speak in a language they all can understand. Biomechanics is a large area that is still spreading and with unlimited possibilities for both fundamental and applied research: from molecular biomechanics, biomechanics of the DNA molecules, microtubules, subcellular structures, biomechanics of cells, dynamics of cellular contacts, interaction between cells, change of mechanical properties of cells during their growth, differentiation, cellular motion in fluids, (for example of white and red blood cells in blood, liquor to spermatozoa in seminal and ovary fluids and others), trough tissue and organ biomechanics to biomechanics of entire organism and its dynamics with other individuals. Fluid biomechanics is a separate area – study of biomechanics of cardiovascular systems in physiological and pathological conditions that results in technical solutions for implants – artificial blood vessels, artificial heart components, and artificial hearts as a whole.... Biomechanics of locomotor systems is one of the most developed areas of biomechanics. Study of behavior of locomotor systems under mechanical load and under electrical stimulation has led to technical solutions that are applied for diagnostics and therapy of locomotor system disorders. Biomechanics of respiratory, urinal and reproductive systems have their contribution to constructing devices without that became indispensable in modern medical practice. Study of living organisms under physiological and pathological conditions and generation of mathematical models that can explain this organization is an activity of prime scientific significance. A lot of knowledge has been acquired, but the question is how to combine all the pieces. Living systems undergo transitory and/or permanent changes in the course of their ontogenesis and it is quite certain that a part of these changes is written in the structure and organization of both the individual and entire system. To cite Dick Swab, a famous Dutch neuroendocrinologist, who first founded a bank of human brains in exploratory purposes, an installation unique both in Europe and the world – “we are our brains”, pointing out the importance of morphogenetic and modifying factors for the physiology of the nervous system.

For better understanding the complexity of living organisms and ourselves, a holistic approach is needed. One of the promising approaches is offered by physics with its quantum-holographic mechanisms of feedback control as early as morphogenesis.

This minisymposium is an attempt to present some of the current topics in biomechanics and present different approaches to the understanding of living systems.

I want to thank all the lecturers who answered this call and took part in this minisymposium. United in our differences, with a multidisciplinary approach the integration of knowledge, creation of new ideas and advancement of science as a whole become possible.

ПРЕДГОВОР

Проучавањем живих система и њиховх подструктура баве се научници из различитих научних области биологије, лекари, молекуларни биологи, биохемичари, физико-хемичари, технолози, физичари, машински инжењери, електроинжењери, математичари, економисти..... Сваки сагледава биолошки систем или његов део, организацију, начин функционисања у физиолошким и патолошким условима обезбеђујући корисна знања. Разноврсност у аналитичком приступу проучавања живих система је неопходна зарад разумевања комплексности грађе и функције биолошких система али је потребно учинити још један корак а то је синтеза свих тих знања до којих су дошли стручњаци из различитих области. За то је важно да се стрчњаци који се баве живим системима међусобно размењују своја знања, а основни предуслов је отвореност за искуство и другачији начин размишљања од клишеа, да говоре међусобно разумљивим језиком.

Биомеханика је велика област која се и даље шири и има неограничено много могућности како за базична тако и за примењена истраживања: од молекуларне биомеханике-нпр.биомеханике ДНК молекула, микротубула, субћелијских структура, биомеханике ћелија, динамике ћелијског контакта, интеракције међу ћелијама, промене механичких својстава ћелија током процеса раста, диференцијације, кретања ћелија у флуидима (нпр белих и црвених крвних зrnaца у крви, ликвору, сперматозоида у семеној течности и течности јајовода), преко биомеханике ткива, органа, органских система, до читавог организма и његове интеракције са другим јединкама.

Посебну област чини биомеханика флуида-проучавање биомеханике кардиоваскуларног система у физиолочким и патолошким условима што за последицу има и техничка решења за имплант-вештачке крвне судове, вештачке залиске, вештачко срце.... Биомеханика локомоторног система је једна од најразвијенијих области биомеханике. Проучавање понашања делова локомоторног система под механичким оптерећењем и при електричној стимулацији довело је до конкретних техничких решења које се примењују за дијагностику и терапију поремећаја локомоторног система. Биомеханика респираторног, уринарног и репродуктивног система дале су свој допринос у конструисању апаратса без којих се данас не би могла замислити савремена медицинска пракса. Проучавање организације животог света у физиолошким и патолошким условима и генерисање математичких модела којима се може објаснити таква организација такође је од великог значаја.

Сакупљено је много знања, подаци су ту, питање је како ћемо их комбиновати...

Живи системи пролазе транзиторне и/или трајне промене током своје еволуције. Засигурно је да део тих промена остаје записан у структури и организацији као јединке тако и читавог система. Што би Dick Swab, чувени холандски неуронендокринолог који је први основао банку људских мозгова у истраживачке сврхе, једнствену у Европи и свету рекао „we are our brains“, истакавши тако значај морфогенетских и модификујућих фактора на физиологију нервног система.

За боље разумевање комплексности живих система па и нас самих неопходан је холистички приступ. Један од обећавајућих приступа нуди физика са квантно-холографским механизмима повратне контроле још у морфогенези.

Овај минисимпозијум је покушај да се прикажу неке актуелене теме из биомеханике и стакну различити приступу у проучавању живих система.

Желим да се захвалим свим предавачима који су се одзвали позиву и узели учешћа у овом минисимпозијуму.

Уједињени у различитостима, мултидисциплинарним приступом могућа је интеграција знања, рађање нових идеја и напредак науке.

E-mails: handjelka@hm.co.rs, handjelka@gmail.com

Curent reserach interests:

biomechanics, reproductive biomechanics, regenerative medicine, modeling of biological systems, DNA elasticity, ageing phenomenons, chaos in biological systems, nonlinear dynamics of biological systems.

Scholarships and awards:

2000-2004. Scholarship of Foundation for Young Scientists and Artists, Serbia

2000. scholarship of Norwegian Government "For a generation that promises",

2011. **EUROMECH ENOC Young Scientist Prize 2011, La Sapienza University Rome**, at 7th European Nonlinear Dynamics Conference, 26-29. July 2011, Rome.

2012.-One month scholarship by The Austrian Agency for International Cooperation in Education & Research (*OeAD-GmbH*).

Project participation:

January 2006 -Octobar 2009. scholarship researcher of Ministry of Science, Republic of Serbia working on a project: "Interaction of immobilized cells, tissues and biologically active molecules in bioreactor systems." No: 142075. Head of project Branko Bugarski, professor at the Faculty of Technology and Metallurgy, University of Belgrade.

2011. -reseracer on a project: "Dynamics of hybrid system of complex structures. Mechanics of Materials." No147001 (2011-), financed by Ministry Of Education, Science And Arts Republic Of Serbia, coordinated trough Mathematical Institute SANU. Head of the Project Katica (Stevanovi) Hedrih, Mathematical Institute SANU.

Professional training:

16.09.-30.09.2004. "Urology and Surgery Department of Hospital No 41, Russian Federation, Yecatarinburg, student excange program.

13.9.-20.9. 2004. "Family Medicine Center", Russian Federation, Yecatarinburg, student excange program.

3-8. јули 2006.-aftergraduet cours- *Cell and Tissue Engineering* international summer school, Faculty for technology and metallurgy, Belgrade, Serbia.

22. и 29. мај 2004.-Bichervioral and cognitive neuroscience, Nis, Serbia

Profesional membership:

Serbian Chamber of Medicine

Serbain Society of Mechanics

70 years of the Mathematical Institute of SASA, Belgrade, Serbia

ISND - 2007 - ANALYTICAL DYNAMICS OF DISCRETE HEREDITARY SYSTEMS

Cover Design: Katica (Stevanović) Hedrih and Tamara Stevanović

ISBN 978-86-805977-72-2

Approximate equations:
 $\ddot{\varphi} = \Omega^2(\dot{\theta} - \cos\varphi)\sin\varphi$
 $\ddot{\theta} = \Omega^2(\dot{\varphi} - 1)\dot{\varphi} + \Omega^2\cos\varphi\cos\varphi$
 $\ddot{\varphi}\theta = \Omega^2(\dot{\varphi} - 1)(1 + \frac{h_1}{R})\sin\varphi$
 $\ddot{\varphi}\theta = \Omega^2(\dot{\varphi} - 1)(1 + \frac{h_1}{R})\sin\varphi$
